

Gendered Career Choices in Adolescence and their Links to Academic Outcomes:

A Longitudinal Examination of Career Choices using NEPS data

Dr. Jeffrey M. DeVries

Prof. Dr. Fani Lauermann

Institut für Schulentwicklungsforschung (IFS) • TU Dortmund University

Center for Research
on Education and
School Development

National Education Panel Study (NEPS) Projects

- Here at TU Dortmund, there are many projects with NEPS, e.g.:
 - Self-concept as a mediator for risk factors on academic development (DeVries et al, 2021)
 - Differential effects of instructional methods based on subject, student ability, and student background (DeVries et al., 2020)
 - IFS is part of NEPS excellence network (in charge of collecting some of the data)
- Already, 60 publications this year with NEPS
 - Inequality in home education during the first COVID-19 lockdown (Sari et al., 2021)
 - Migration background impacts the effect of early institutional childcare upon children's prosocial behavior and peer problems (Konrad-Ristau & Burghardt. 2021)
- But, hardly any of the 1000+ NEPS publications use advanced data science techniques
- Our focus today:
 - Gender typicality of career choices and links to self-concept and ability (in prep)

Gender Differences in STEM/MINT Domains

- Men are overrepresented in STEM fields in Germany and other western countries (e.g., the United States; Bundesagentur für Arbeit, 2019; U.S. Census Bureau, 2019)
- Girls are less likely to aspire to STEM fields (Parker et al., 2012) even when achievement differences are accounted for (Lauermann et al., 2015, 2017)

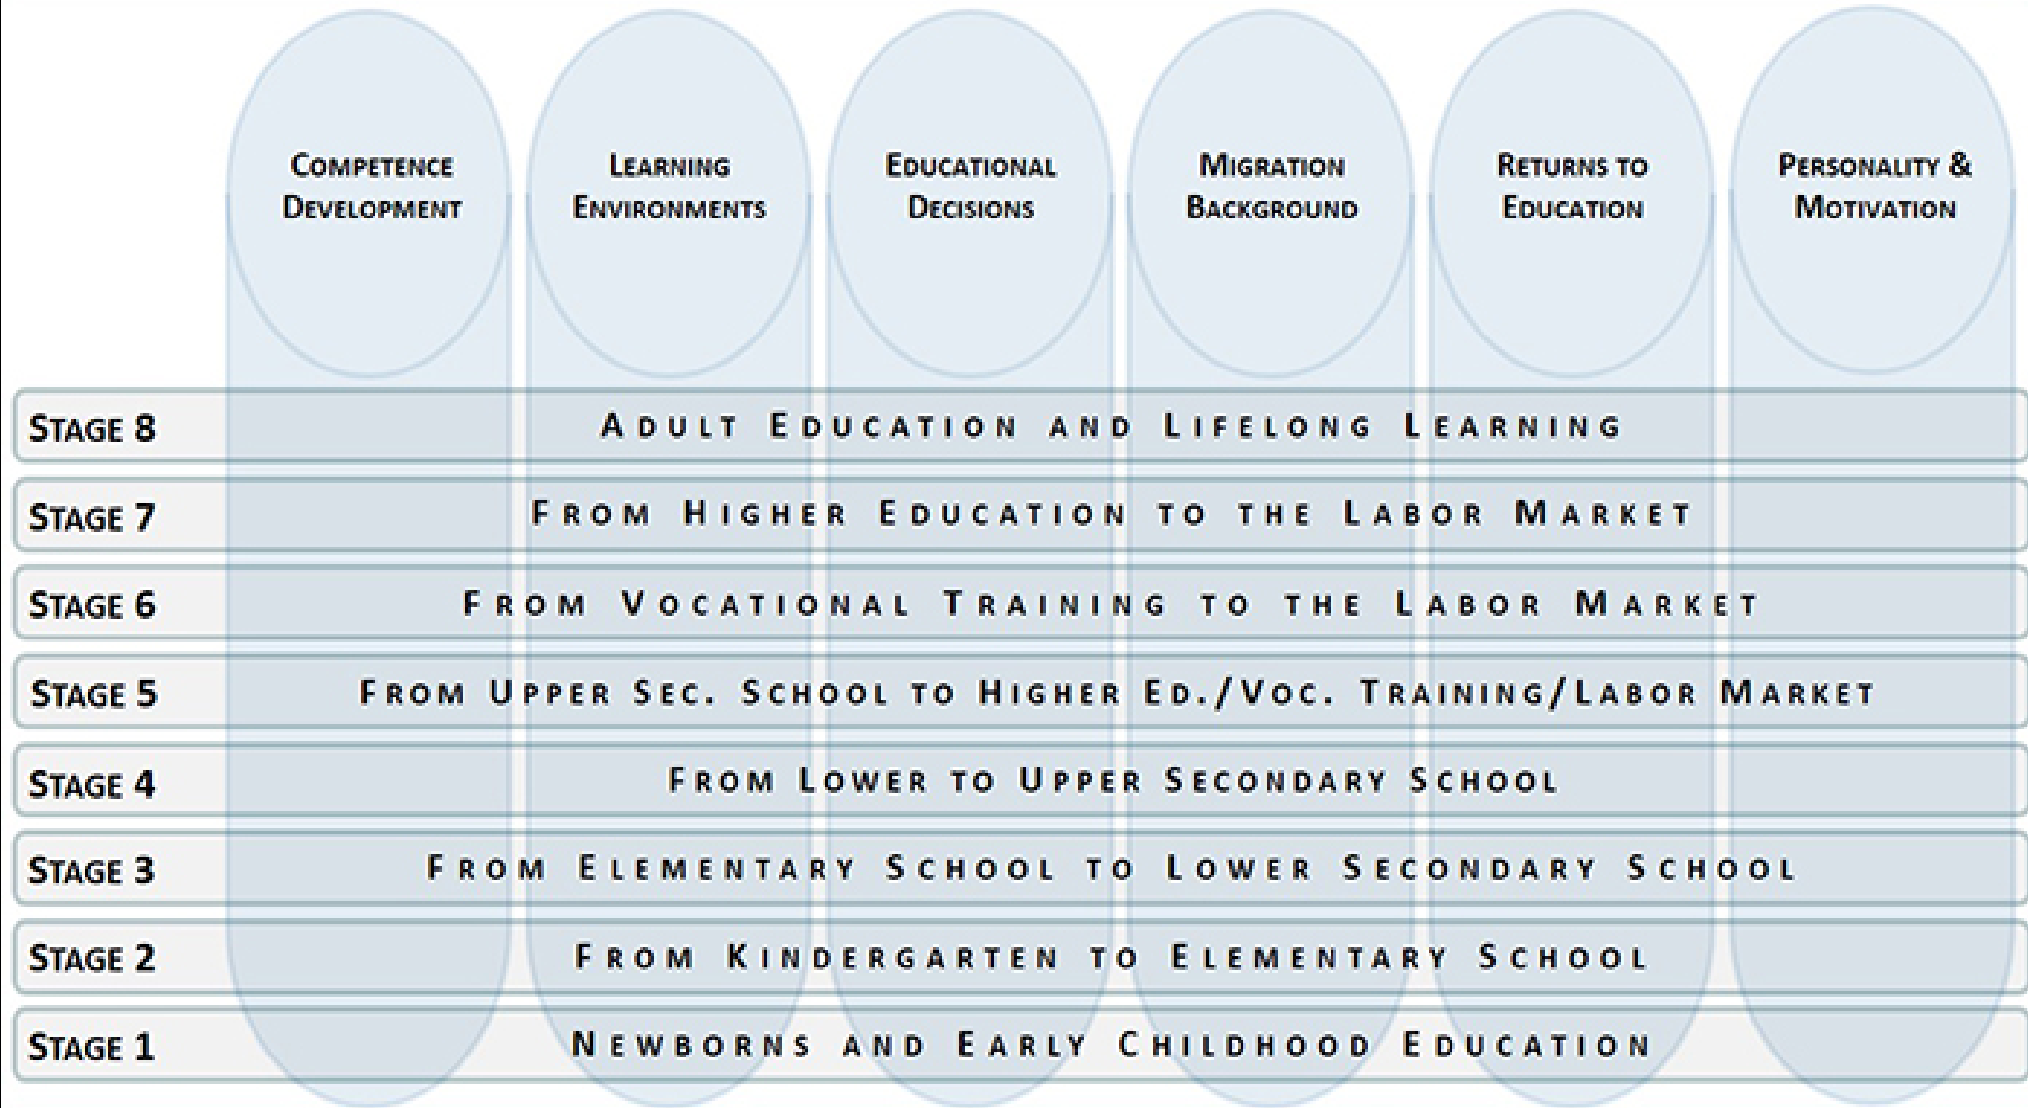

Gender Differences in STEM/MINT Domains

- Girls are more likely to have high achievement in **both** math and reading, and a greater discrepancy between math achievement and self-concept of ability (Lauermann et al., 2015; Wang et al., 2013)
 - Higher ability in the verbal domain may direct girls away from math careers (Breda & Napp, 2019)
 - Motivational factors (e.g., self-concept) may push girls away from STEM fields
- How does career choice relate to the gender typicality of that career, and does this change over schooling?
 - How does gender-typicality relate to STEM careers?
 - How does gender-typicality relate to math and reading achievement and self-concept, as well as gender?

Methods – Intro to NEPS

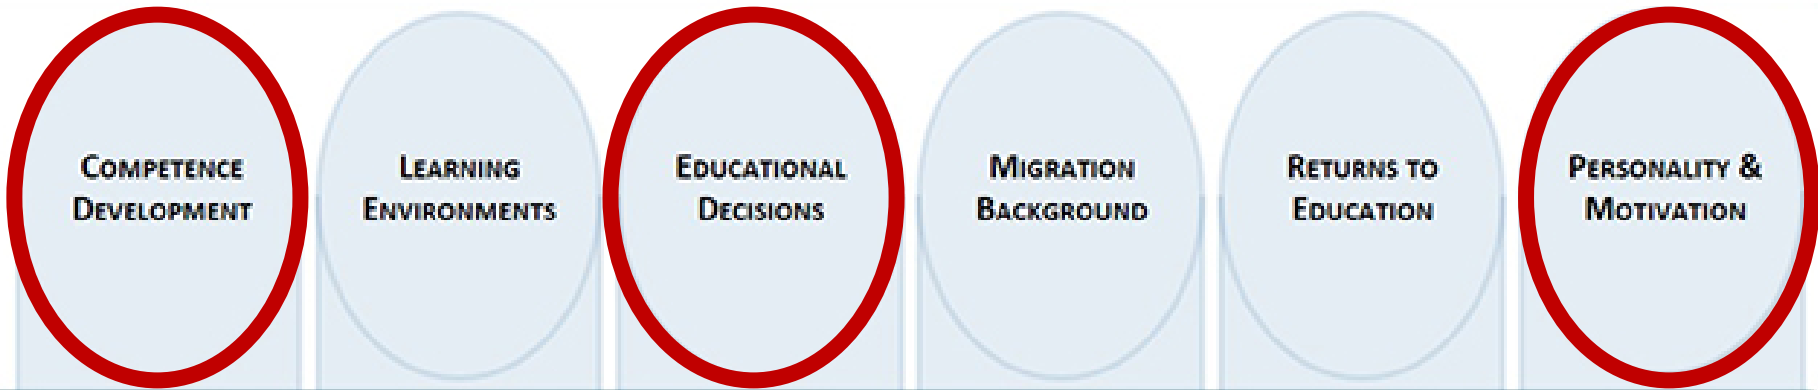

- Started in 2008 to study education in Germany
 - Permanently funded since 2014
- Multi-cohort longitudinal study of German pupils, students, and adults
- Data from many perspectives & sources

**ADMINISTRATION AND CENTRAL COORDINATING

STAGE 8	ADULT EDUCATION AND LIFELONG LEARNING
STAGE 7	FROM HIGHER EDUCATION TO THE LABOR MARKET
STAGE 6	FROM VOCATIONAL TRAINING TO THE LABOR MARKET
STAGE 5	FROM UPPER SEC. SCHOOL TO HIGHER ED./VOC. TRAINING/LABOR MARKET
STAGE 4	FROM LOWER TO UPPER SECONDARY SCHOOL
STAGE 3	FROM ELEMENTARY SCHOOL TO LOWER SECONDARY SCHOOL
STAGE 2	FROM KINDERGARTEN TO ELEMENTARY SCHOOL
STAGE 1	NEWBORNS AND EARLY CHILDHOOD EDUCATION

RESEARCH DATA CENTER AND METHOD DEVELOPMENT

Methods – Measures

- Data from Starting Cohort 4 (SC4)
 - Began data collection in grade 9
 - 4759 Gymnasium students
 - Data from students and their parents
- Career preference (open-ended)
 - Concurrent census data about the gender proportion of chosen job category
 - Measured in 9th, 10th, 11th, and 12th year (Gymnasium only in our study)
- Math and German self-concept
- Math and reading competence

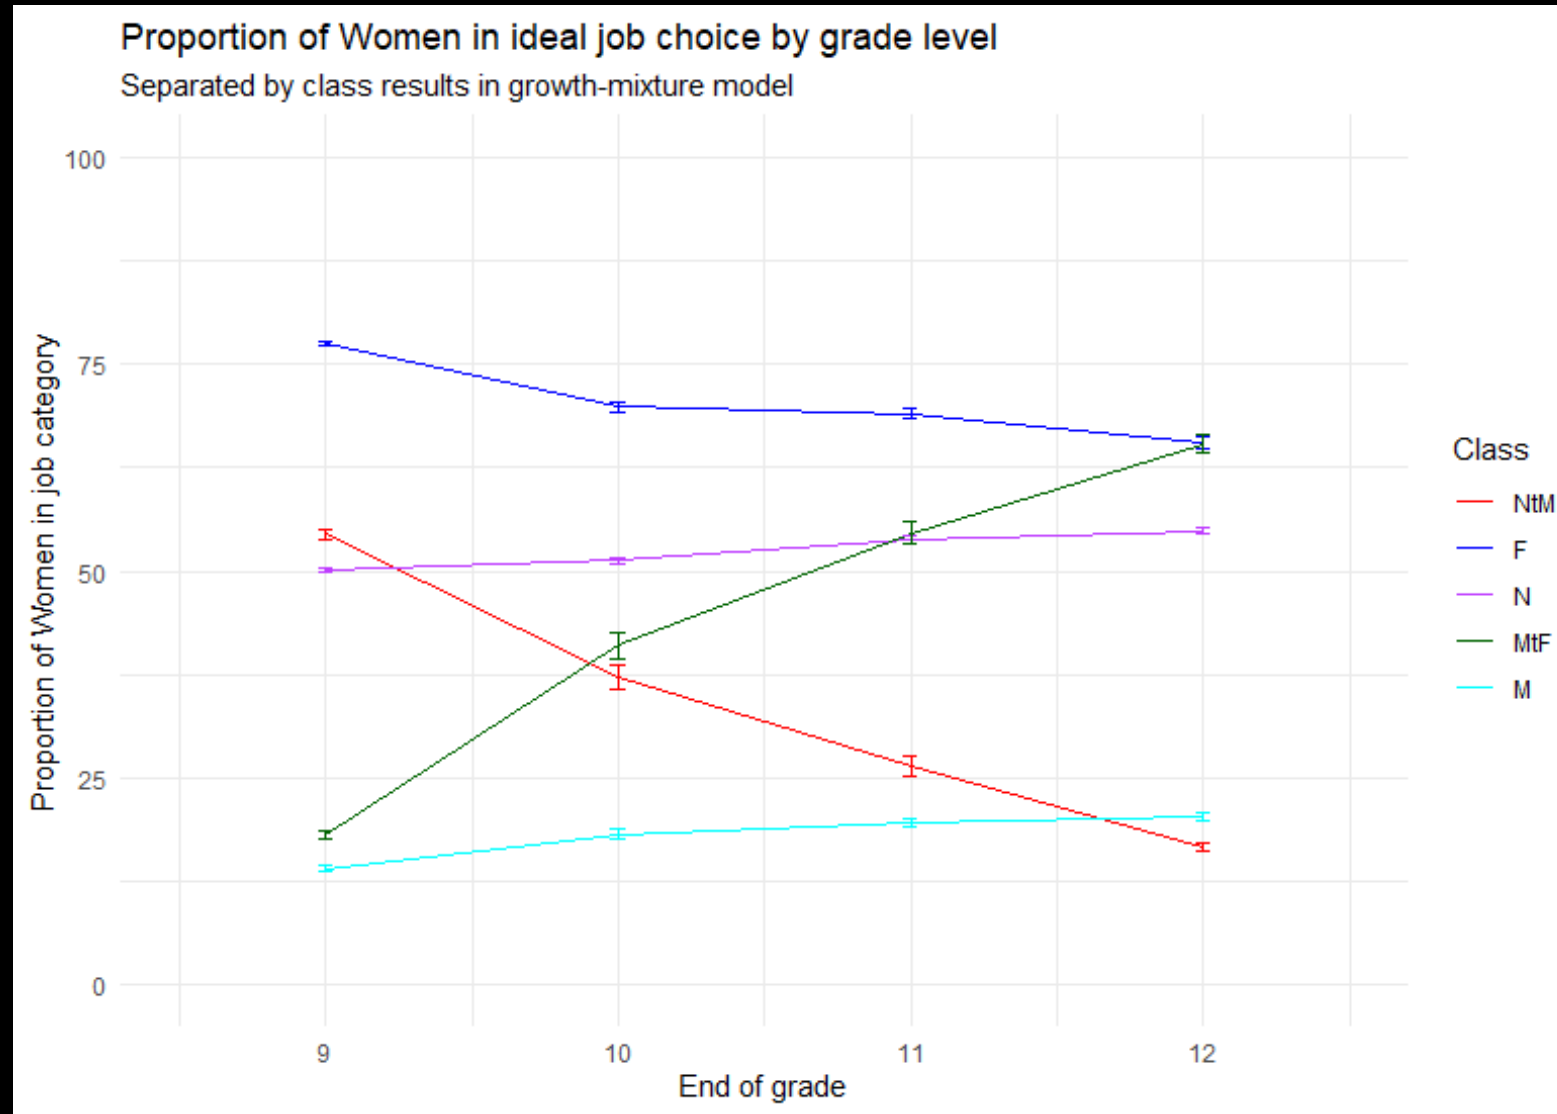

<u>MATH</u>	<u>GERMAN</u>
I get Good Grades	I get good grades
It's one of my best subjects	I learn fast
I've always been good at it	I'm a hopeless case (Reversed)

Methods – Growth Mixture Modeling

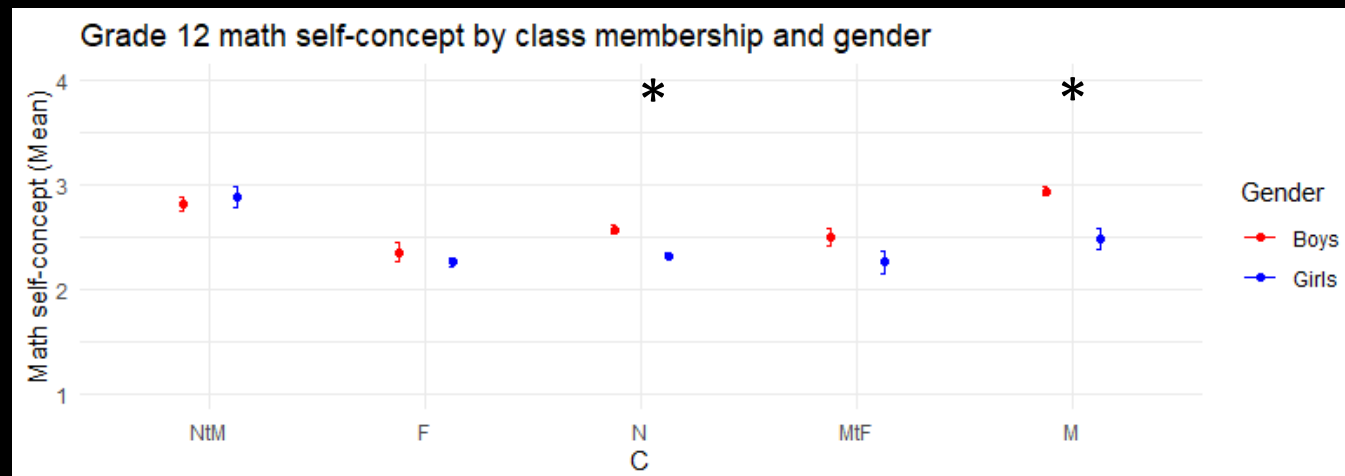

- A latent growth model is fitted to the proportion of women in career choice data from 9th-12th grade
- Mixture modeling to identify the number of different trajectories of career choice development
- 5-class model had the best fit (via AIC and BIC)

The Trajectories:

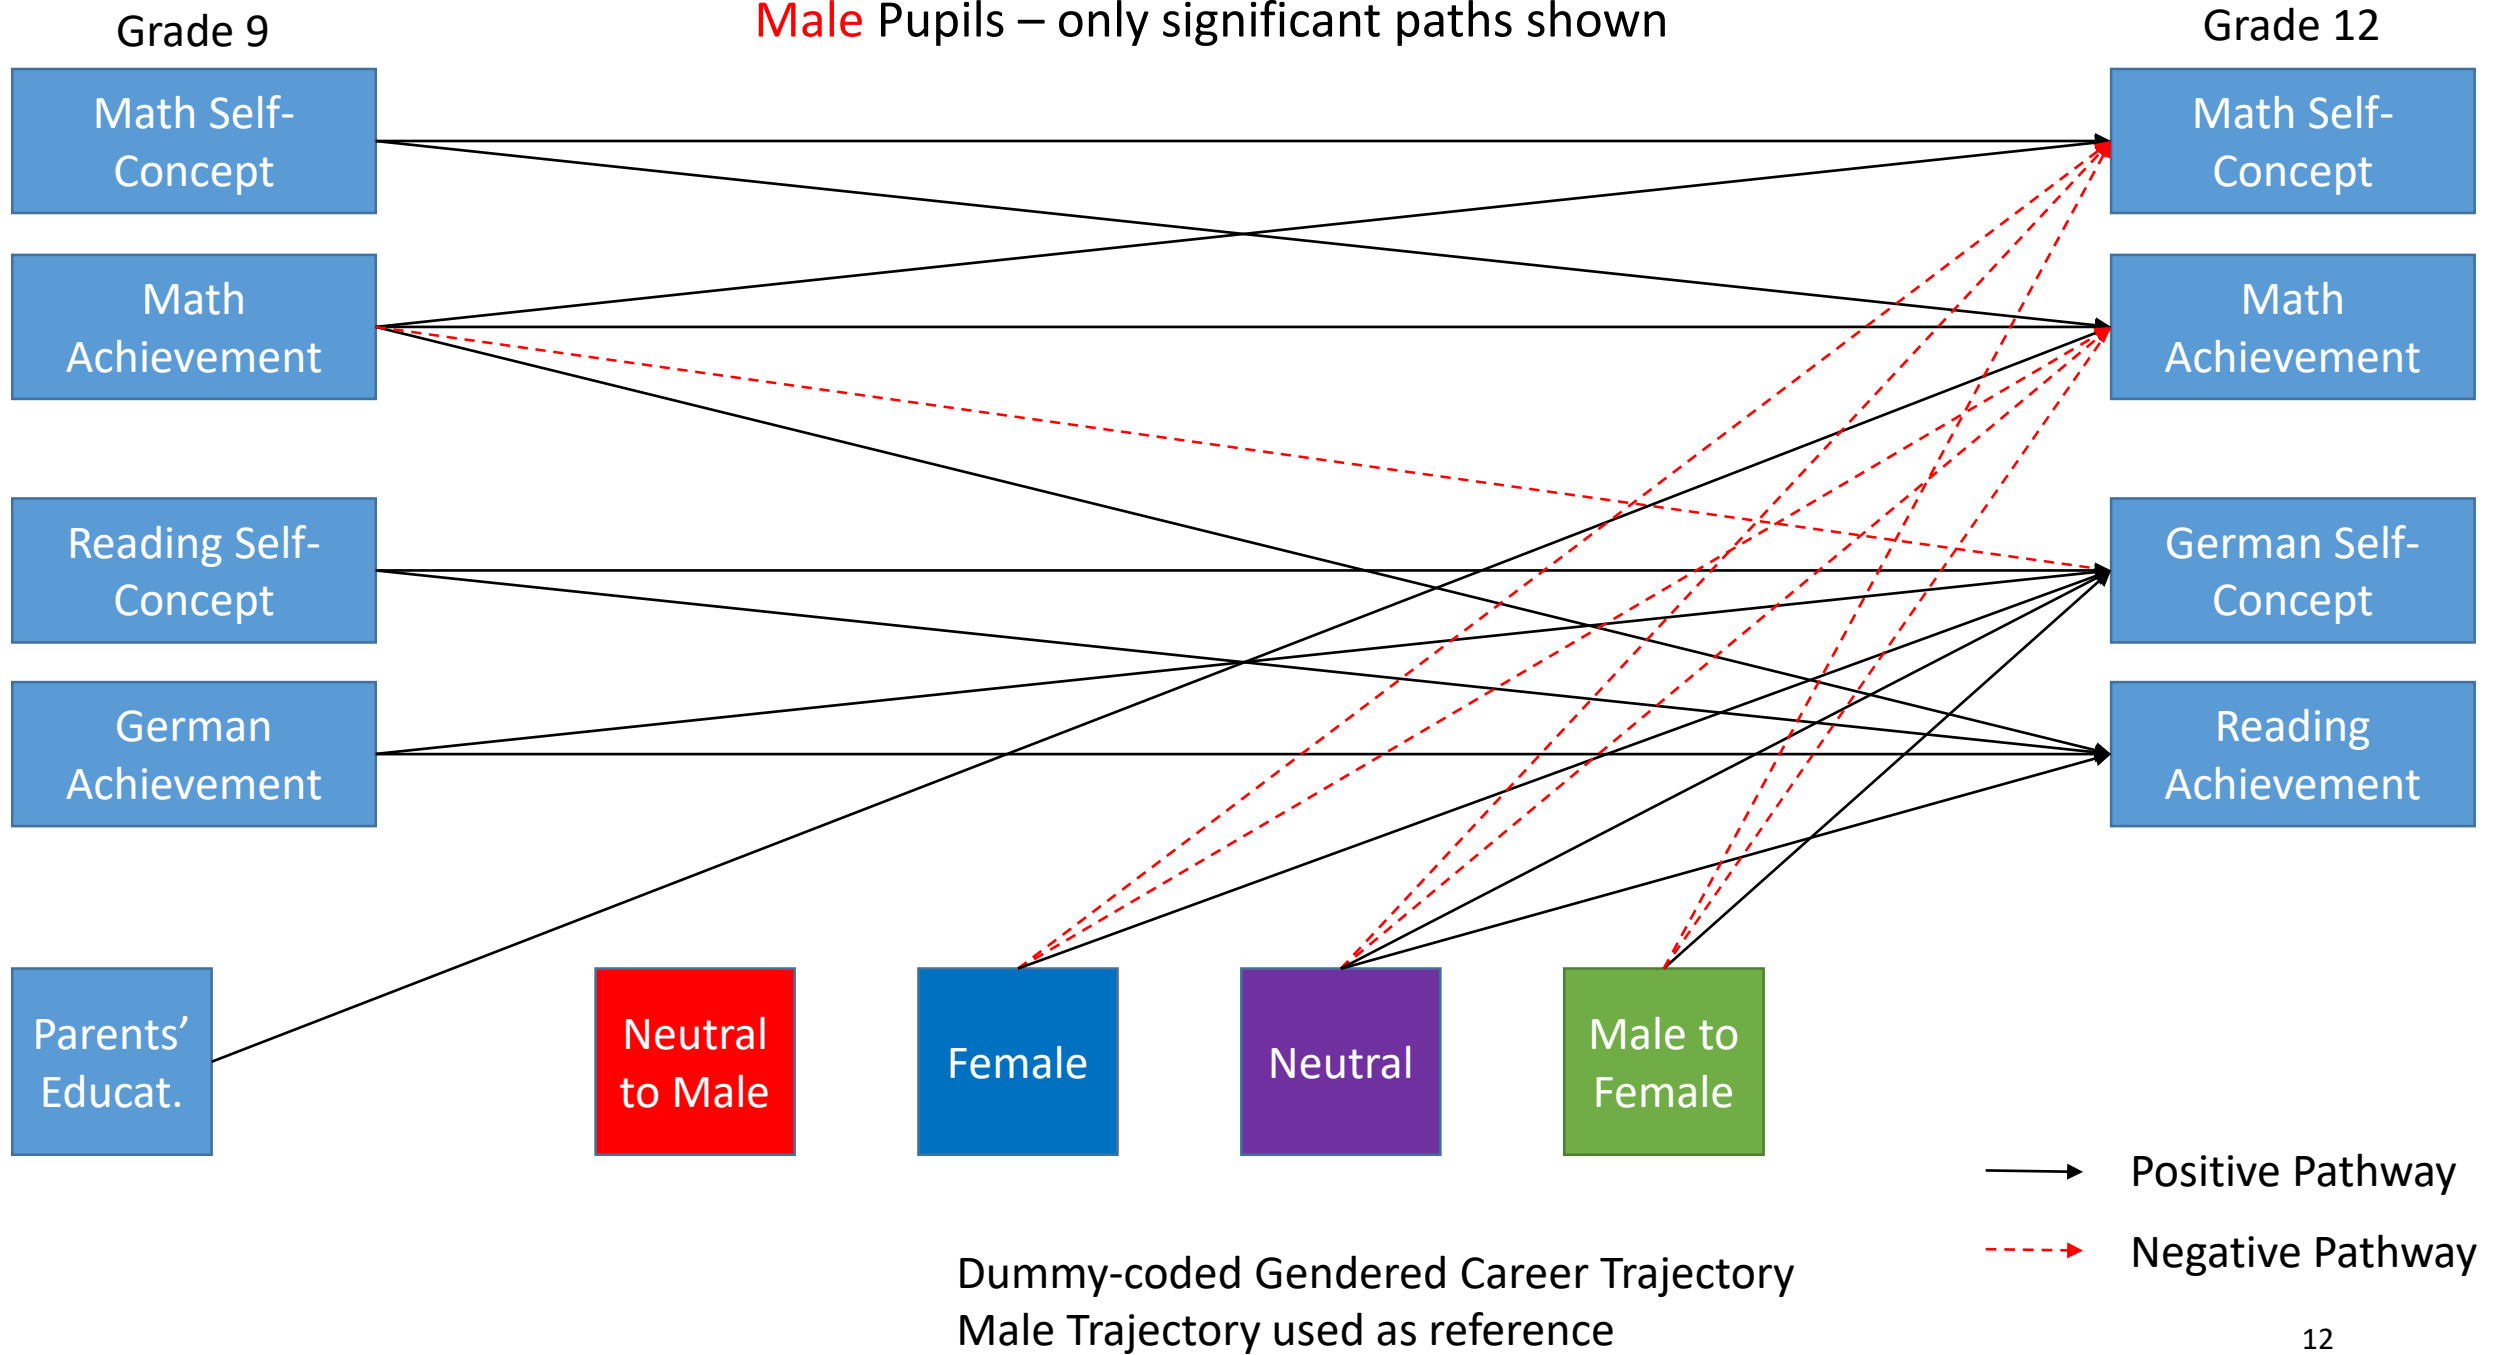

- Blue: Female Jobs (F)
 - 20.7%, N=983
- Purple: gender-neutral jobs (N)
 - 47.8%, N=2276
- Teal: Male Jobs (M)
 - 19.3%, N=920
- Red: Neutral to Male Jobs (NtM)
 - 6.3%, N=300
- Green: Male to Female jobs (MtF)
 - 5.9%, N=280

Math Achievement and Self-Concept by Gender and Trajectory

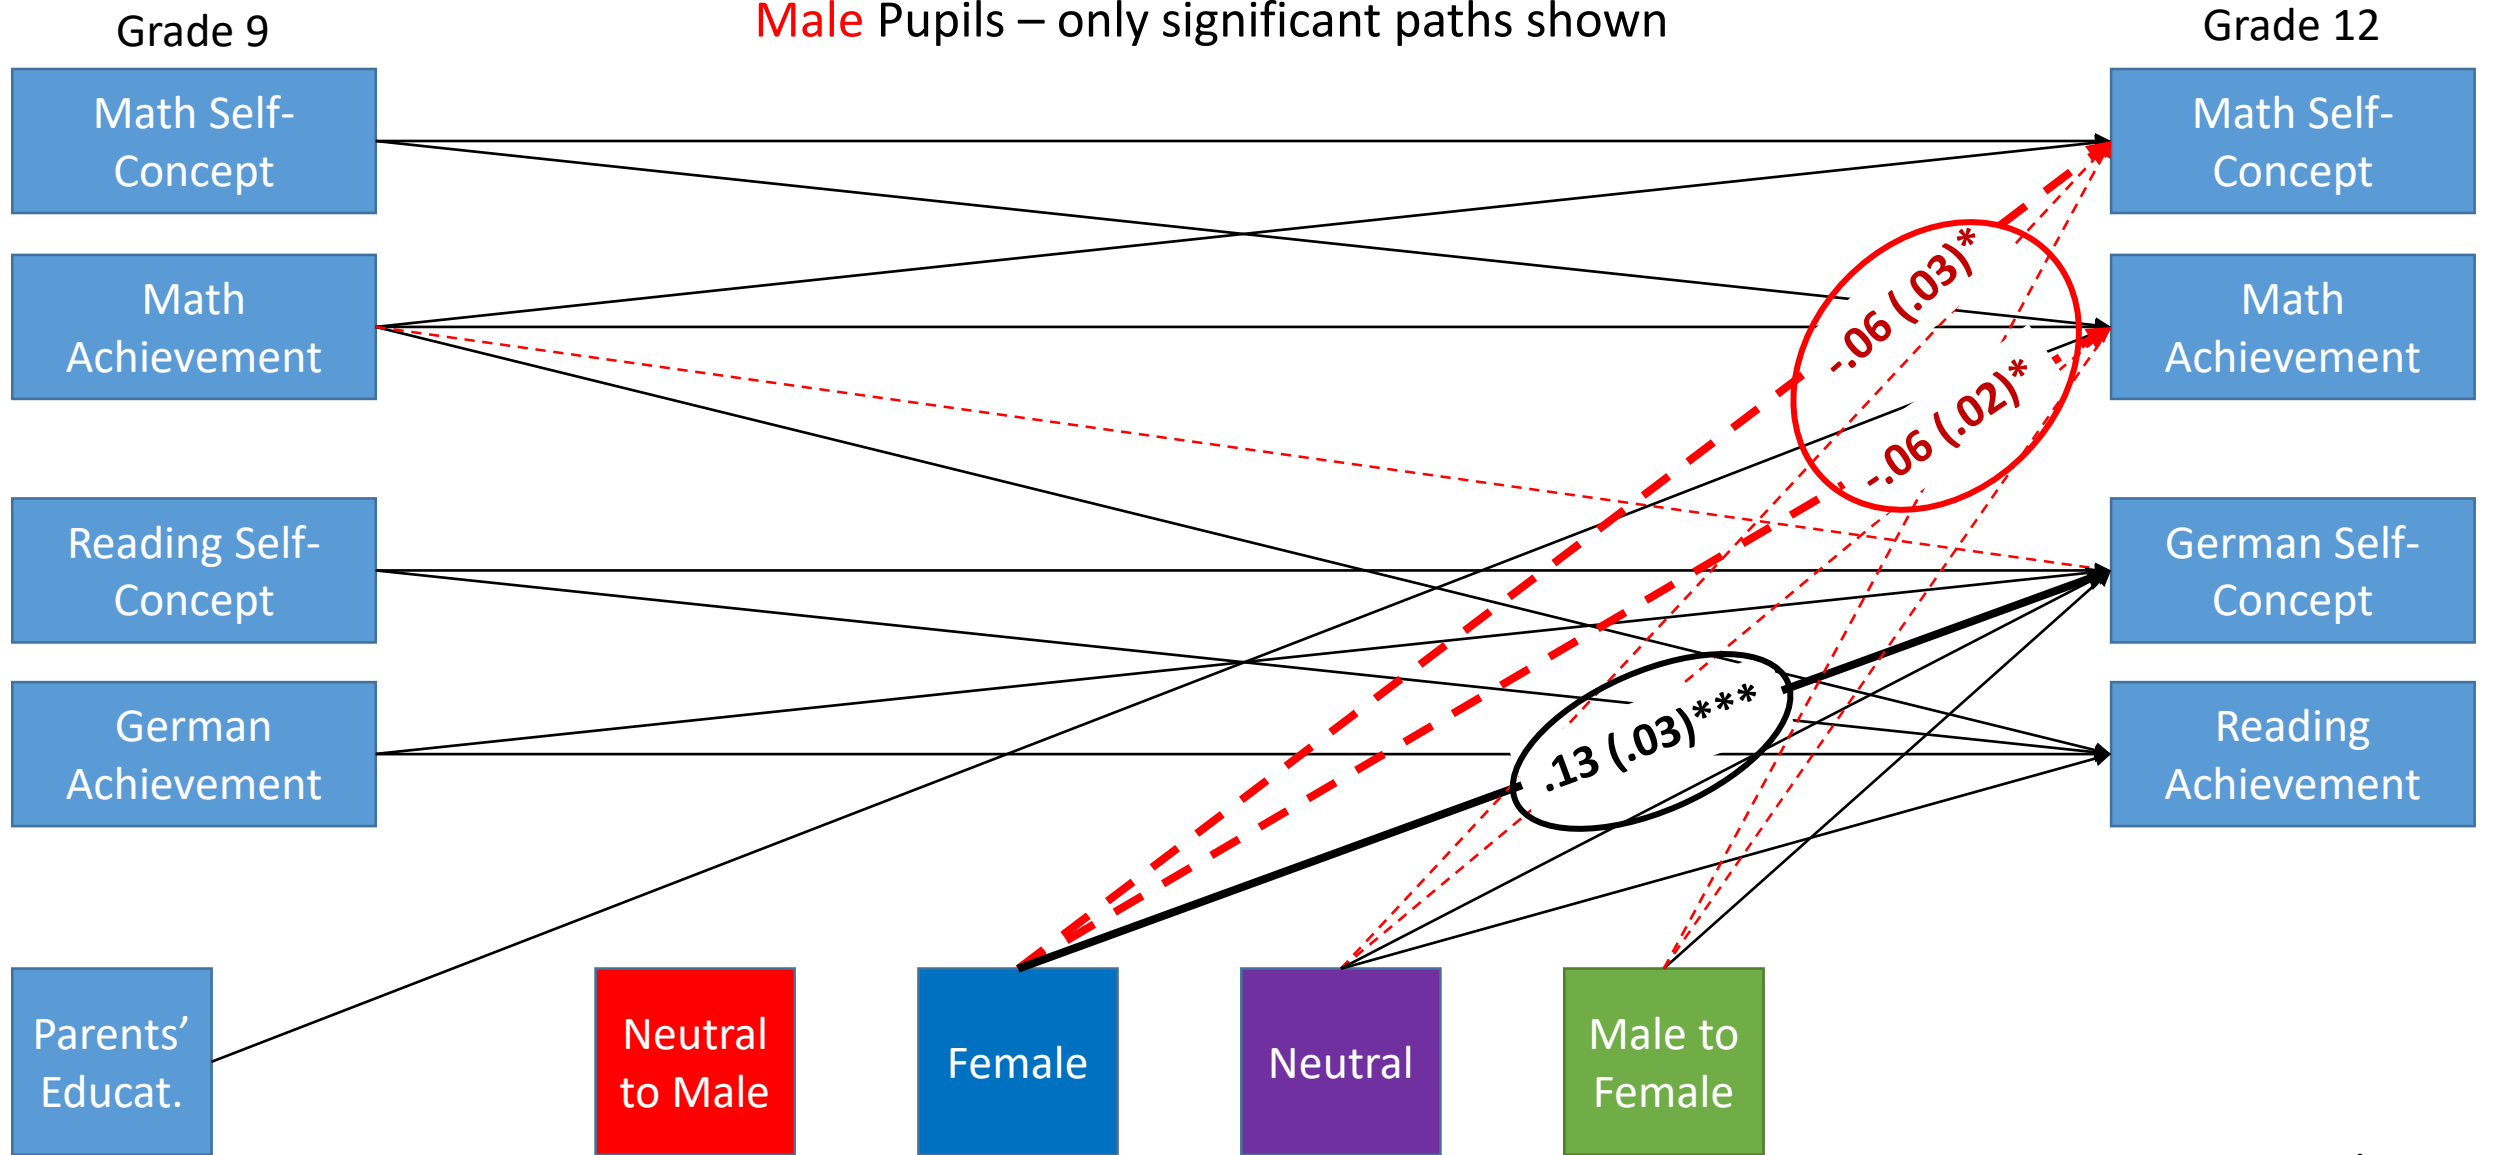

Male Pupils – only significant paths shown

Dummy-coded Gendered Career Trajectory
 Male Trajectory used as reference

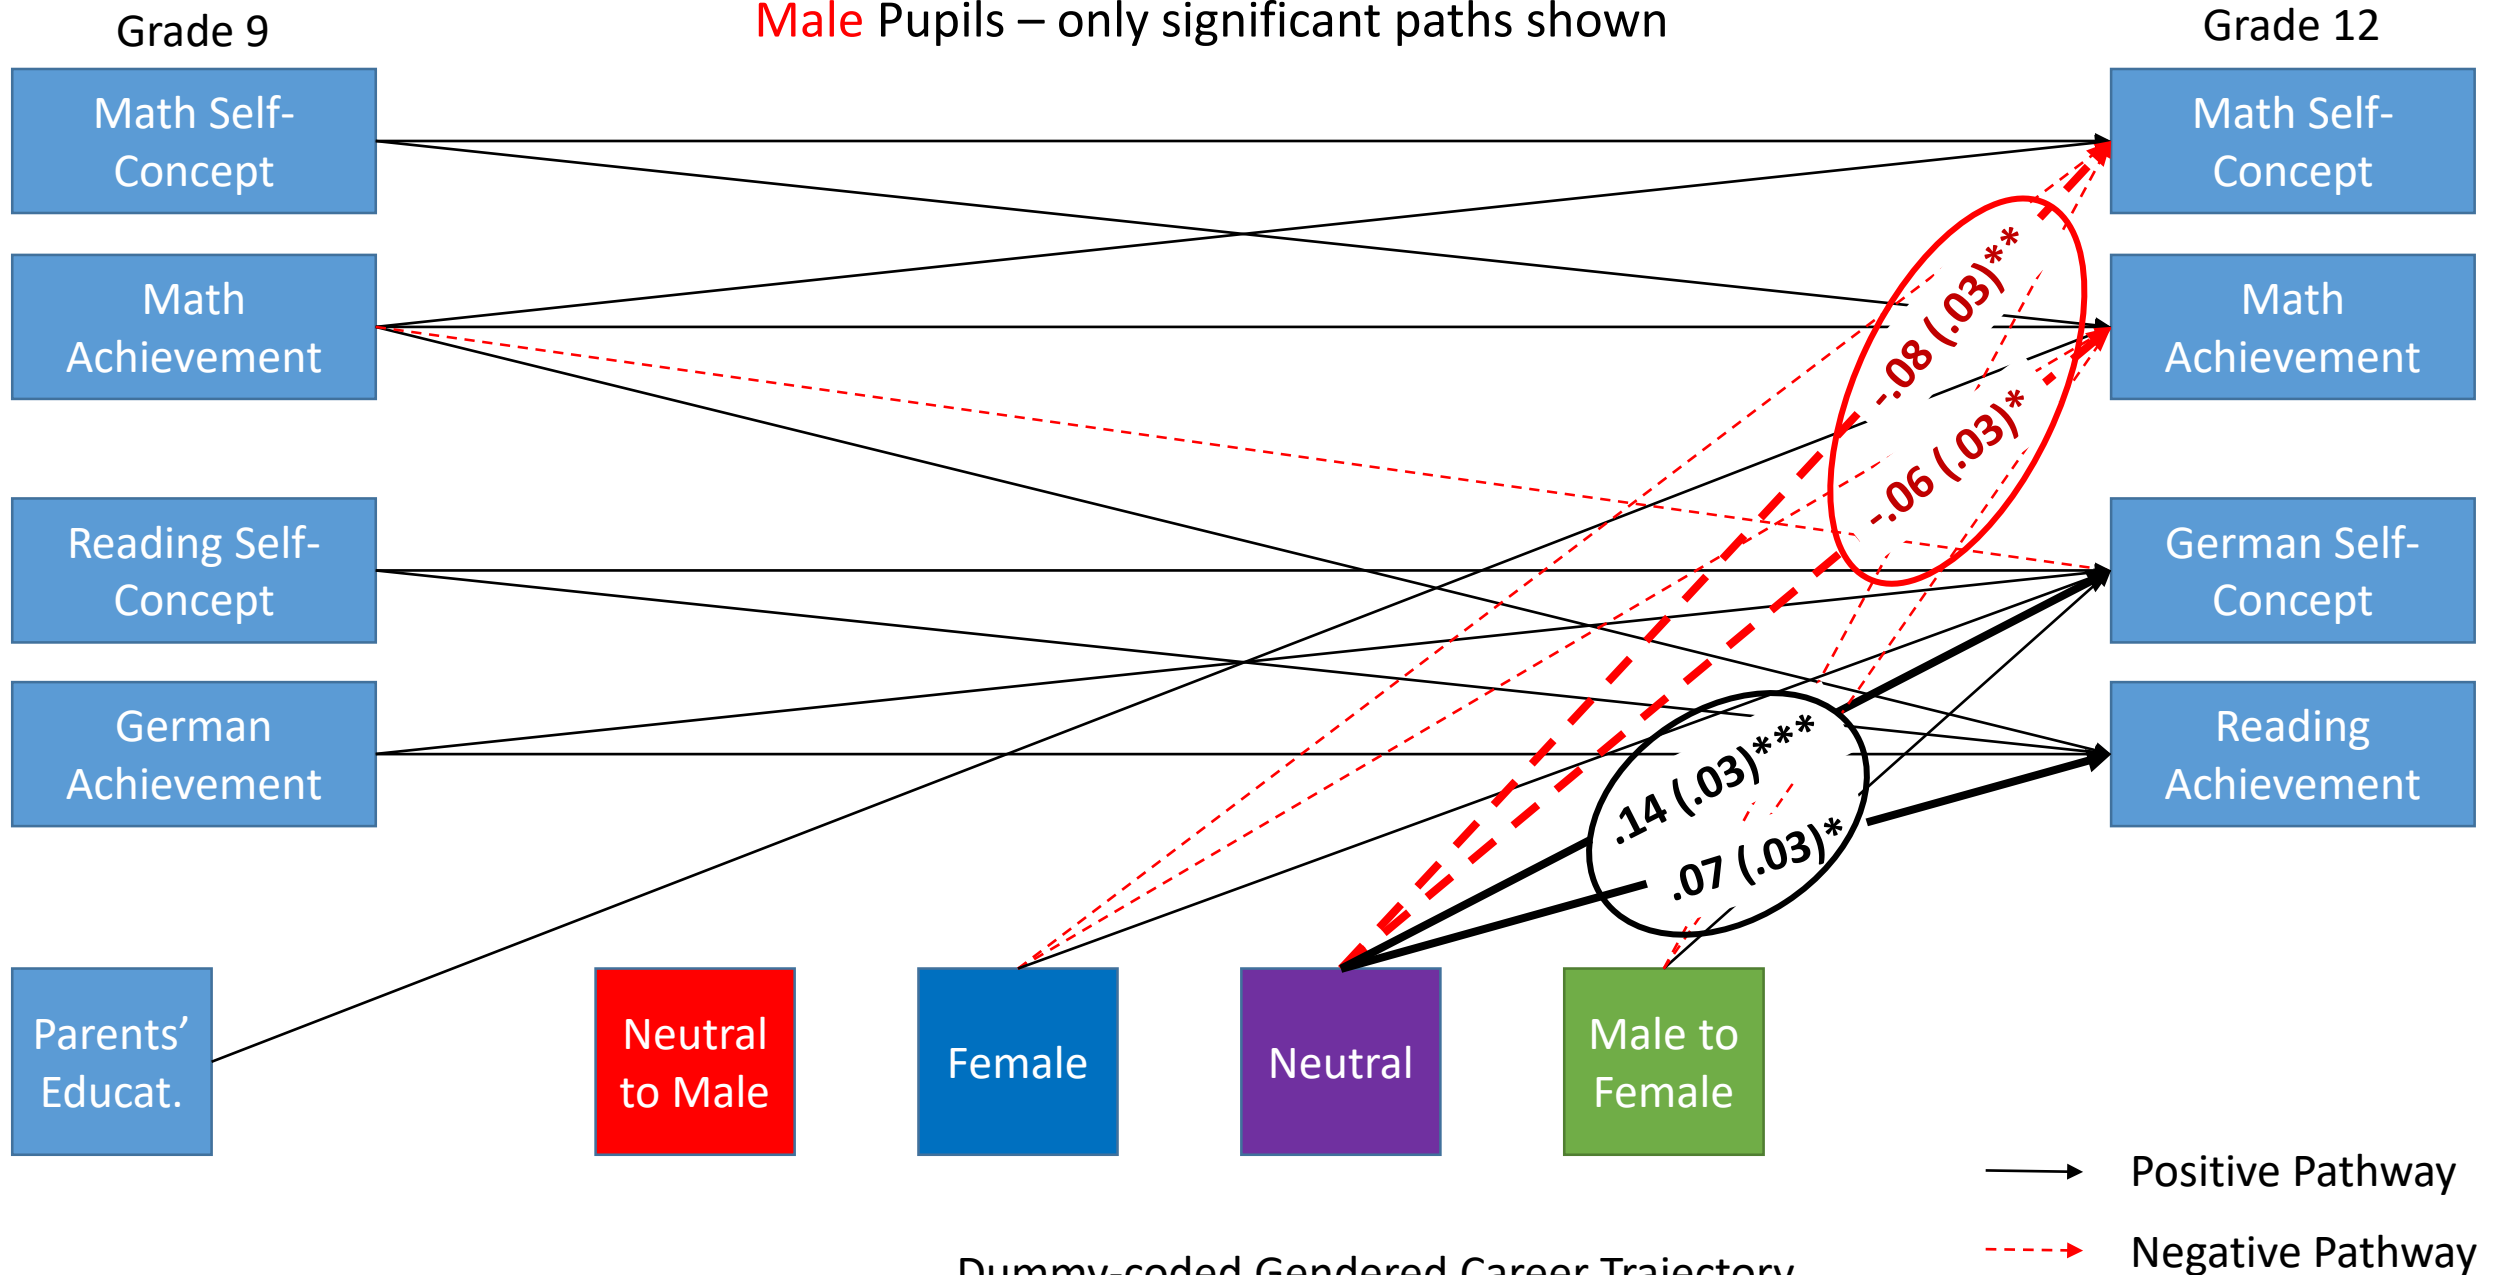

Male Pupils – only significant paths shown

→ Positive Pathway
 - - - - - Negative Pathway

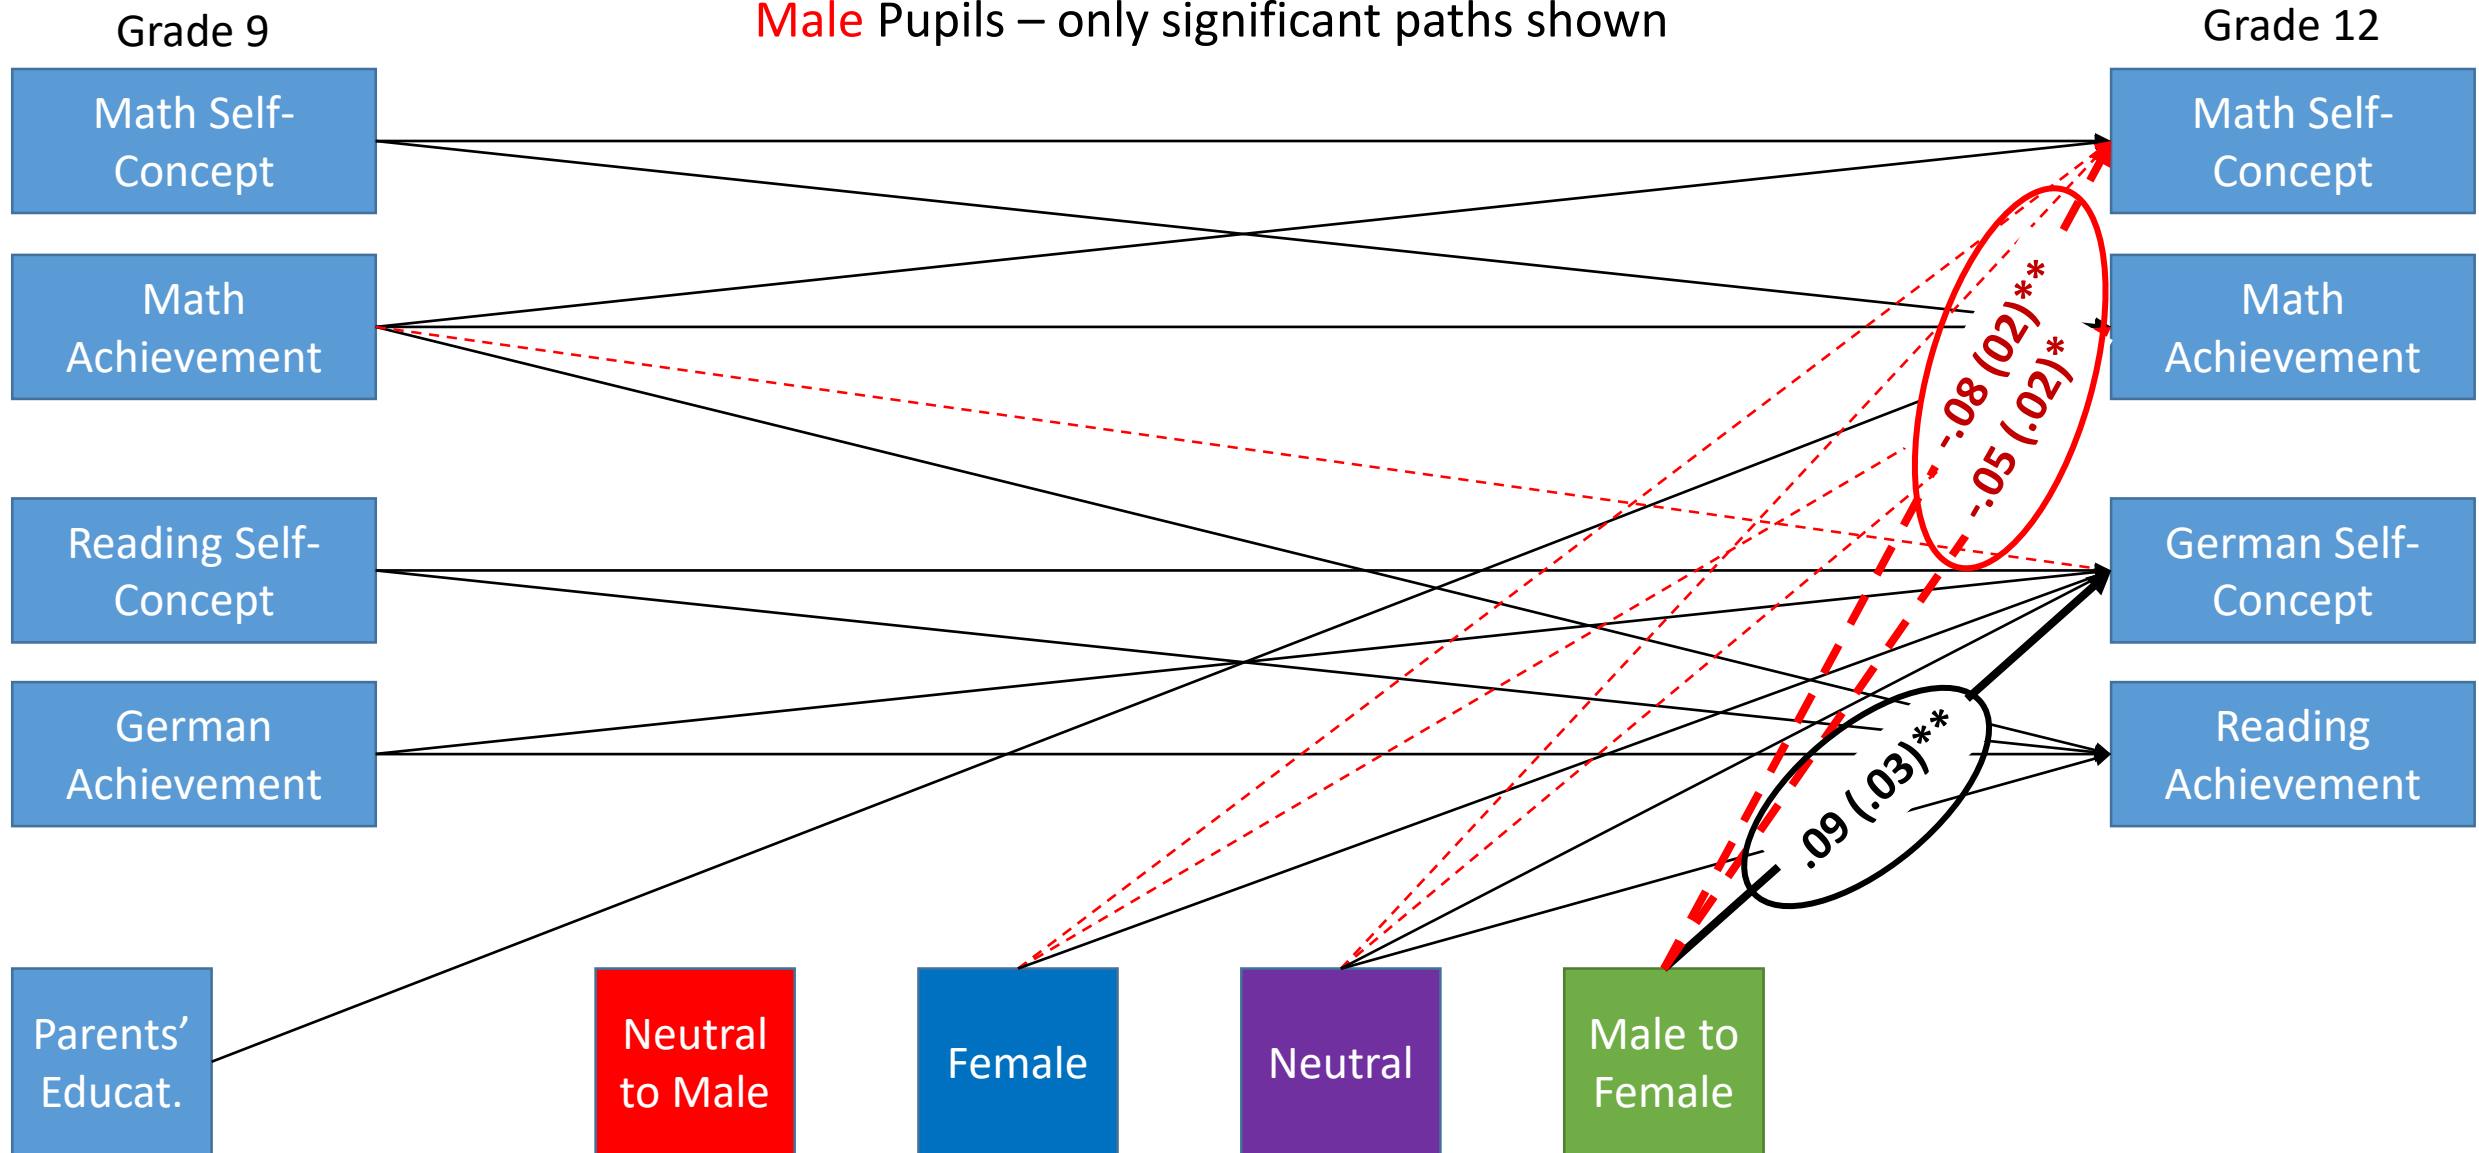

Dummy-coded Gendered Career Trajectory
 Male Trajectory used as reference

Male Pupils – only significant paths shown

Dummy-coded Gendered Career Trajectory

 Positive Pathway
 Negative Pathway

Dummy-coded Gendered Career Trajectory
 Male Trajectory used as reference

Female Pupils – only significant paths shown

Dummy-coded Gendered Career Trajectory
Male Trajectory used as reference

→ Positive Pathway
- - - Negative Pathway

Results Summary

- Identified 5 career choice trajectories across late secondary school based on gender proportions of preferred careers
 - 3 stable trajectories: male dominated, female dominated, and neutral
 - 2 transition trajectories: male to female dominated and neutral to male dominated
- In contrast to girls, boys' career choice trajectories relate to corresponding changes in academic beliefs and competence across both math and German
- For girls, switching to a male-dominated career choice relates to gains in math achievement, but not self-concept

Outlook

- NEPS has over 1000 publications since 2008, only one publication and one working paper use machine learning:
 - A double machine learning approach to estimate the effects of musical practice on student's skills (Knaus, 2021)
 - Early identification of college dropouts using machine-learning: Conceptual considerations and an empirical example (Isphording & Raabe, 2019)
- NEPS is a rich dataset which tracks many important variables as well as later life outcomes
- The planned research profile **FAIR** will expand upon this work by bringing together research groups from data science, statistics, and social sciences (e.g., education)

Boys

Girls

Model Selection

# of Classes	AIC	BIC	Adjusted BIC	Entropy	Size of Smallest Class
1	127,936	128,022	127,980	<i>n.a.</i>	<i>n.a.</i>
2	115,915	115,992	115,954	0.647	1207
3	115,407	115,504	115,457	0.735	964
4	115,283	115,400	115,342	0.740	231
5	115,186	115,322	115,255	0.697	280

Models above 6 starts produced invalid results, and thus were excluded from consideration.

Note: AIC refers to adjusted information criteria. BIC refers to Bayesian information criteria.

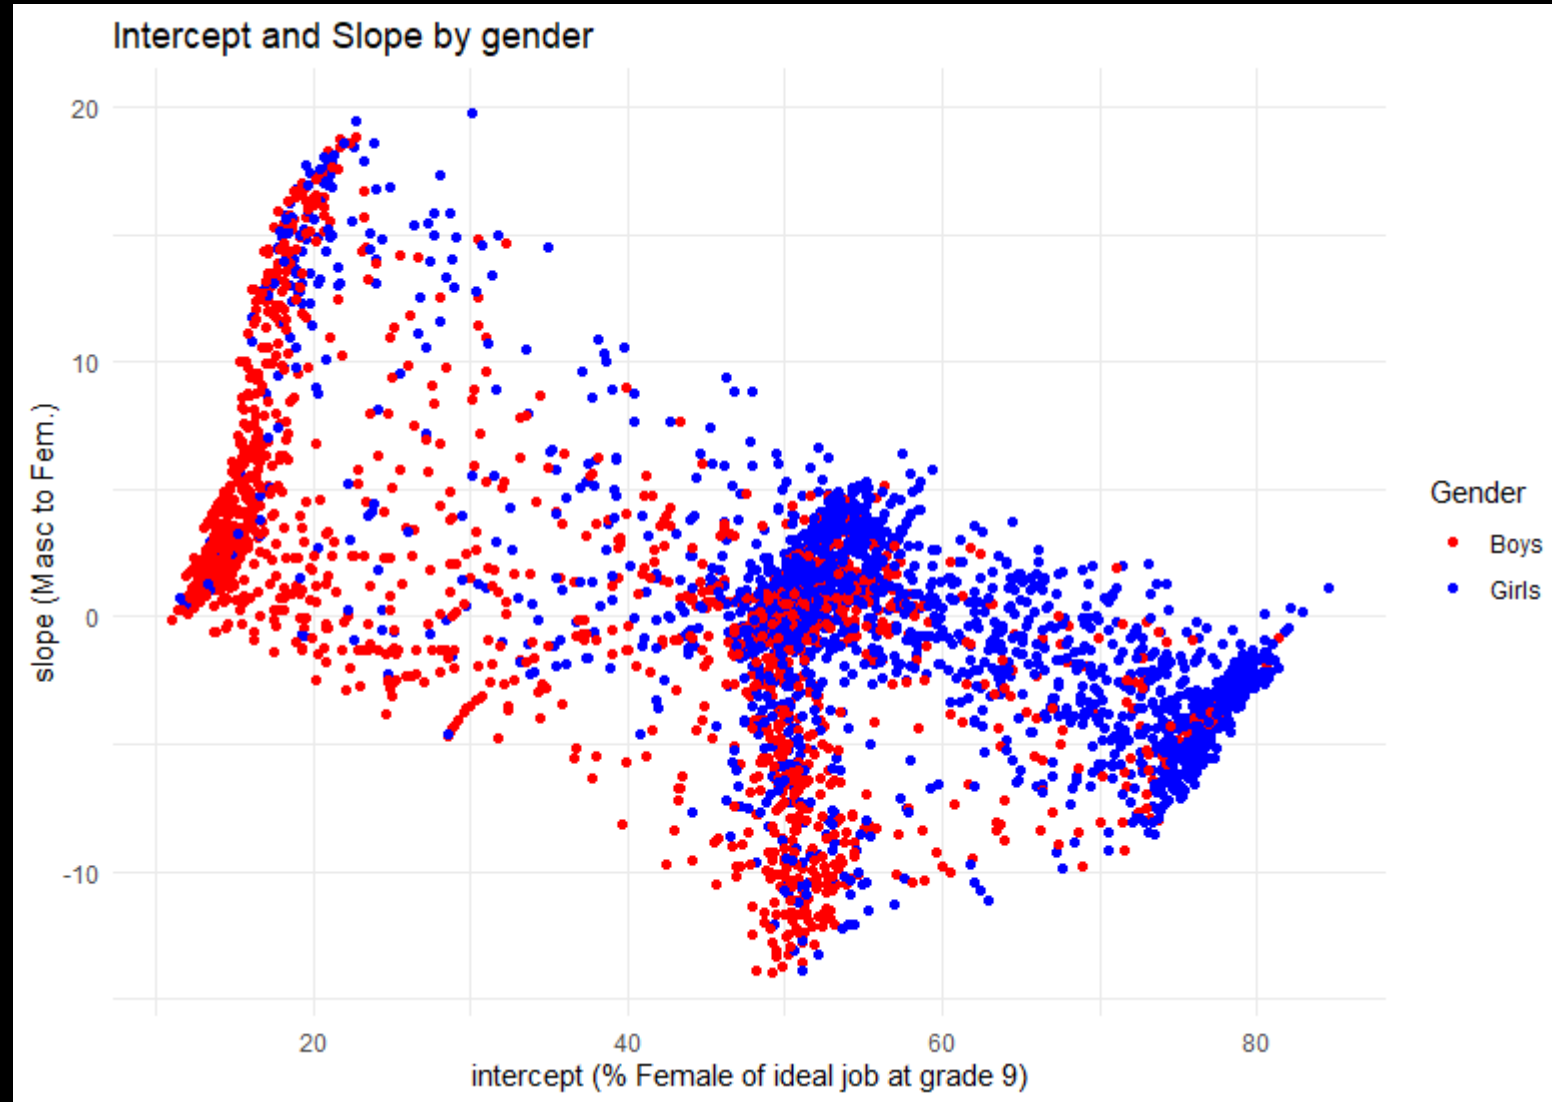

Latent Class Separation

- Classes are well defined by intercept and slopes of career-choice trajectories

Latent Class Separation – Gender

- And by Gender

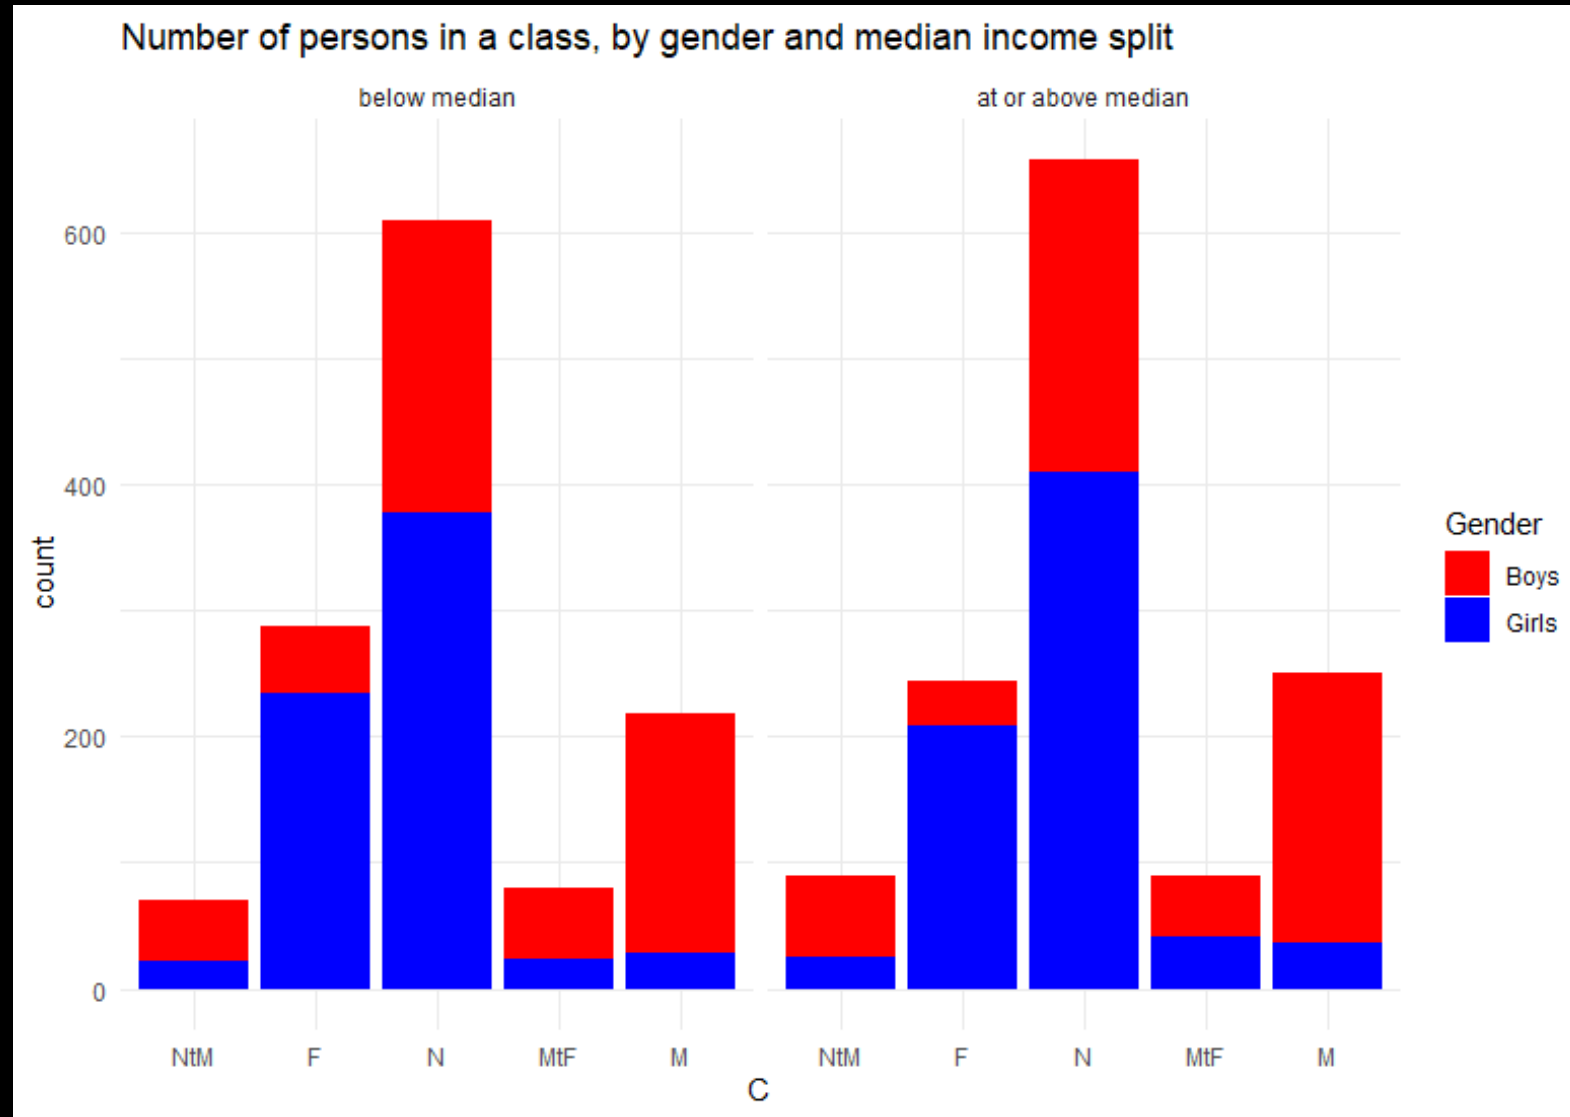

Methods – Measures (2 of 2)

- Math and German Self-concept
 - Self-Report, 4 pt. Likert scale
 - Mean scores
 - 9th & 12th Grade
- Math and Reading Competence
 - Achievement testing
 - 9th & 12th Grade
 - 0-centered WLE values (for 9th Grade value)
- SES
 - Monthly household income
 - Parental Education level (University degree vs. no degree).

<u>MATH</u>	<u>GERMAN</u>
I get Good Grades	I get good grades
It's one of my best subjects	I learn fast
I've always been good at it	I'm a hopeless case (Reversed)

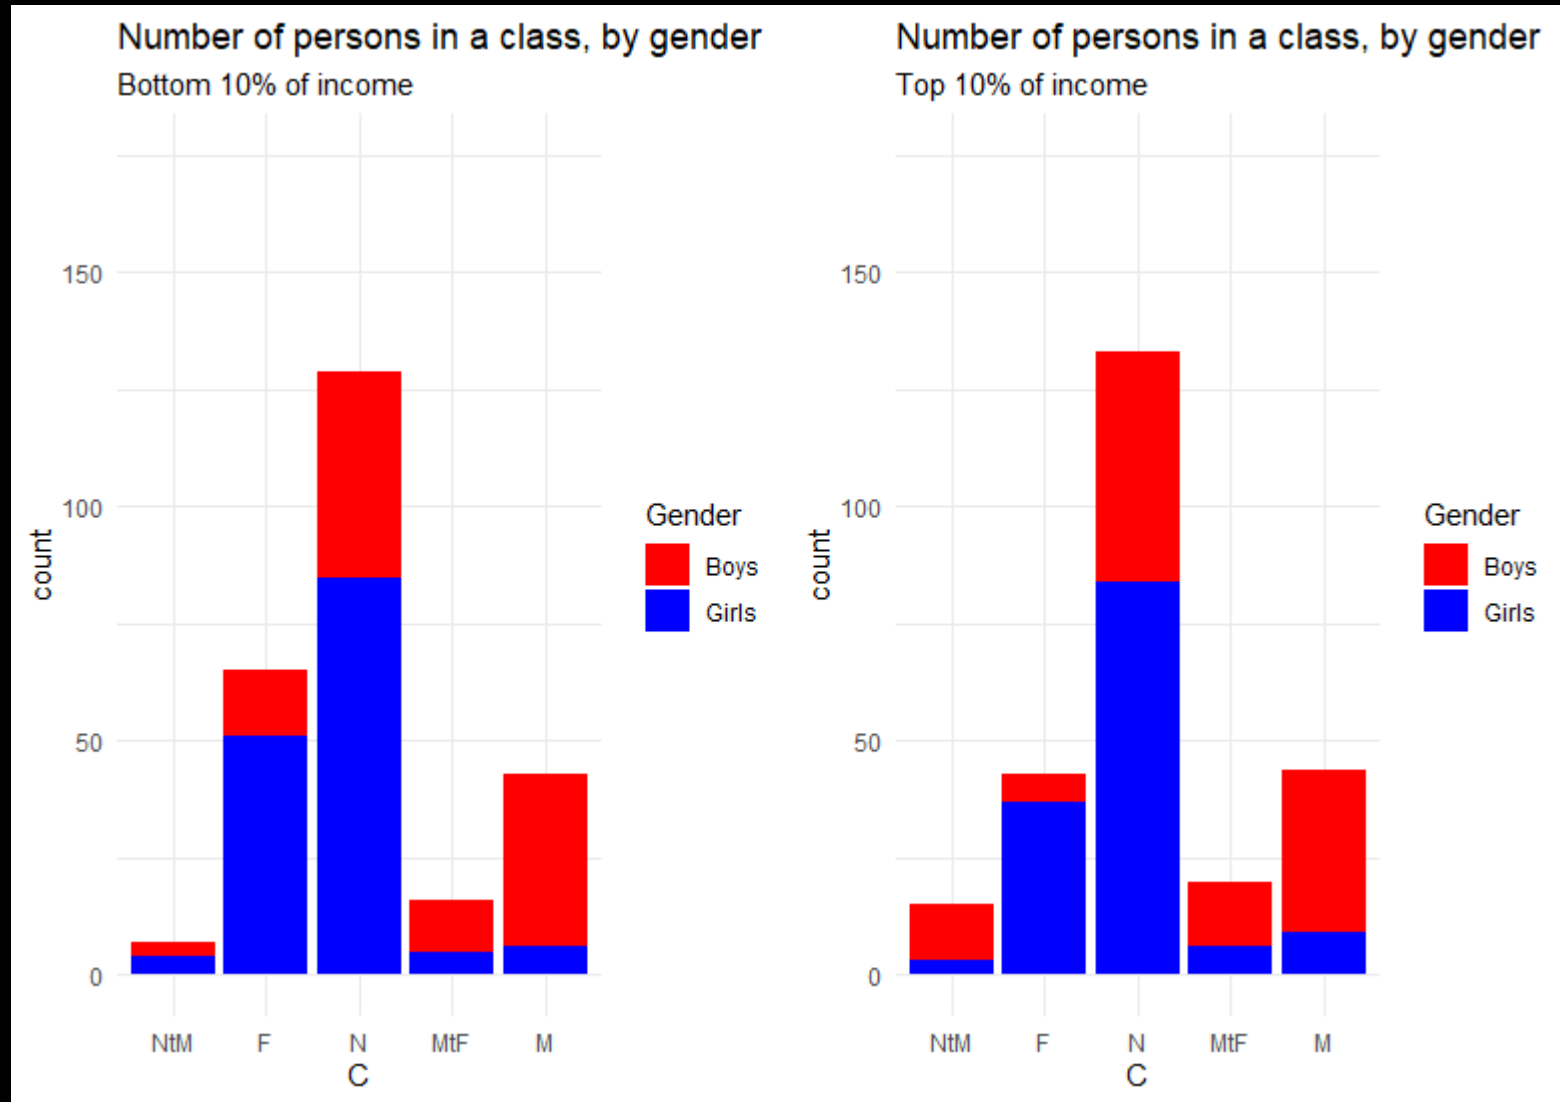

Class Membership, Gender and SES

- Gender dictates class membership
- But so does SES

Class Membership and SES

- Splits by top and bottom income deciles
- Class F shrinks dramatically – particularly for boys
- Higher proportion of girls in M and MtF classes
- Smaller proportion of girls in NtM class

Development and Career Choice from Gottfredson

- Career Choices go through stages of “circumscription”
- Late Childhood/preadolescence
 - Opposite gendered jobs are excluded
- Early Adolescence
 - Jobs outside of own perceived SES are excluded
- Late Adolescence/Teens
 - Compromise period based on personal interests/values/abilities
